# Gridded Population of the World

- Raster data product developed to provide a **spatially-disaggregated population surface** that is compatible with data sets from social, economic, and Earth science fields.
- Census population data are transformed from their native spatial units to a global grid of quadrilateral latitude-longitude cells (Balk et al. 2010)
- Free and openly available

GPW version 3, 2000 population density

Transforming census units to a grid

# History of GPW

- GPWv1 was an outgrowth of a Global Demography Workshop held at CIESIN in 1994
- Consensus that a consistent global database of population totals in raster format would be invaluable for interdisciplinary study (Deichmann et al., 2001)
- Produced by Waldo Tobler, Uwe Deichmann, Jon Gottsegen, and Kelly Maloy at the UC Santa Barbara

INTERNATIONAL JOURNAL OF POPULATION GEOGRAPHY, VOL. 3, 203-225 (1997)

## World Population in a Grid of Spherical Quadrilaterals

### ABSTRACT

We report on a project that converted subnational population data to a raster of cells on the earth. We note that studies using satellites as collection devices yield results indexed by latitude and longitude. Thus it makes sense to assemble the terrestrial arrangement of people in a compatible manner. This alternative is explored here, using latitude/longitude quadrilaterals as bins for population information. This format also has considerable advantages for analytical studies. Ways of achieving the objective include, among others, simple centroid sorts, interpolation, or gridding of polygons. The results to date of putting world boundary coordinates together with estimates of the number of people are described. The estimated 1994 population of 219 countries, subdivided into 19,032 polygons, has been assigned to over six million five minute by five minute quadrilaterals covering the world. These results are available over the Internet. The grid extends from latitude 57°S to 72°N, and covers 360° of longitude. Just under 31% of the (1548 by 4320) grid cells are populated. The number of people in these countries is estimated to be 5.6 billion, spread over 132 million km<sup>2</sup> of land. Extensions needed include continuous updating, additional social variables, improved interpolation methods,

correlation with global change studies, and more detailed information for some parts of the world. © 1997 John Wiley & Sons, Ltd.

### INTRODUCTION

Information on the world's population is usually provided on a national basis. But we know that countries are ephemeral phenomena, and administrative partitionings of a country are irrelevant to much scientific work. As an alternative scheme one might consider ecological zones rather than nation states, yet there is no agreement as to what these zones should be. By way of contrast global environmental studies using satellites as collection devices yield results indexed by latitude and longitude. Thus it makes sense to assemble information on the terrestrial arrangement of people in a compatible manner. A recent pilot study demonstrated some practical advantages of gridded population data (Clarke and Rhind, 1992), including reporting the potential impact of sea level rise on inhabitants of the coastal region of a Scandinavian country. The project described here extends the compilation to much of the entire Earth, using latitude/longitude quadrilaterals as bins for population information. In addition to its compatibility with environmental information this data format has considerable advantages for analytical studies, and the data

# Development of GPW

Publication Year	Years of Estimation	Grid Resolution	Number of Input Units (subnational geographic units)	Census variables	Population Density Grid	
GPWv1	1995	1994	5 arc-minute (10 km)	19,000	Total Population	 1994
GPWv2	2000	1990, 1995	2.5 arc-minute (5 km)	127,000	Total Population	 1995
GPWv3	2005	1990, 1995, 2000	2.5 arc-minute (5 km)	~ 400,000	Total Population	 2000
GPWv4	2015	2000, 2005, 2010, 2015, 2020	30 arc-second (1 km)	~ 12,500,000	Total Population, Sex, Age, Urban/Rural status	 2010

# GPWv4 Workflow

Match to geographic boundaries (census or administrative)

Adjust boundaries to global framework and mask inland water

Estimate the population for target years (2000, 2005, 2010, 2015, 2020)

# GPWv4 Workflow

# GPWv4 Workflow

# GPW is minimally-modeled

- GPW uses the areal-weighting method
  - Uniformly distributes population based on land area
  - Does not incorporate ancillary data (e.g. land use/land cover, transportation networks, elevation, etc.)
- Maintains fidelity to input data
- The accuracy of GPW pixel estimates is directly related to the size of the input census units

Higher resolution boundaries in eastern China lead to more accurate population distributions

# Improvements to GPWv4

1

Increased resolution of input census units

2

Addition of gridded census variables

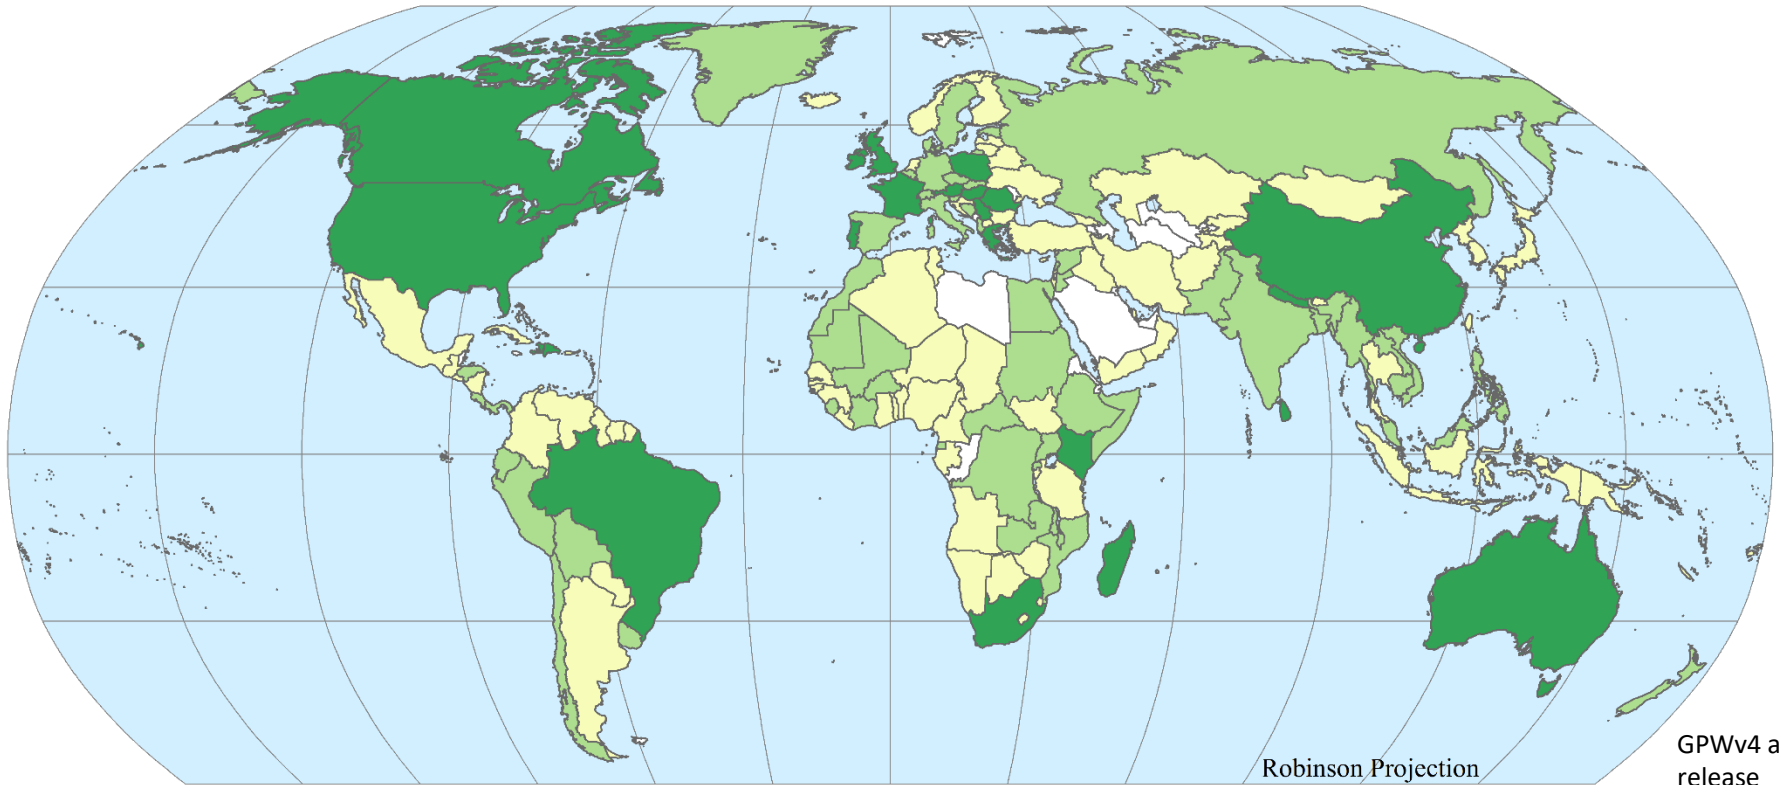

# 1

## Increased resolution of input census units

### Number of Input Census Units

	GPWv3	GPWv4
Global	399,747	12,497,563

# GPWv4 Administrative Level

## 2

## Addition of gridded census variables

Demand to **include demographic information** in global population grids

**GPWv4 will include detailed global grids for:**

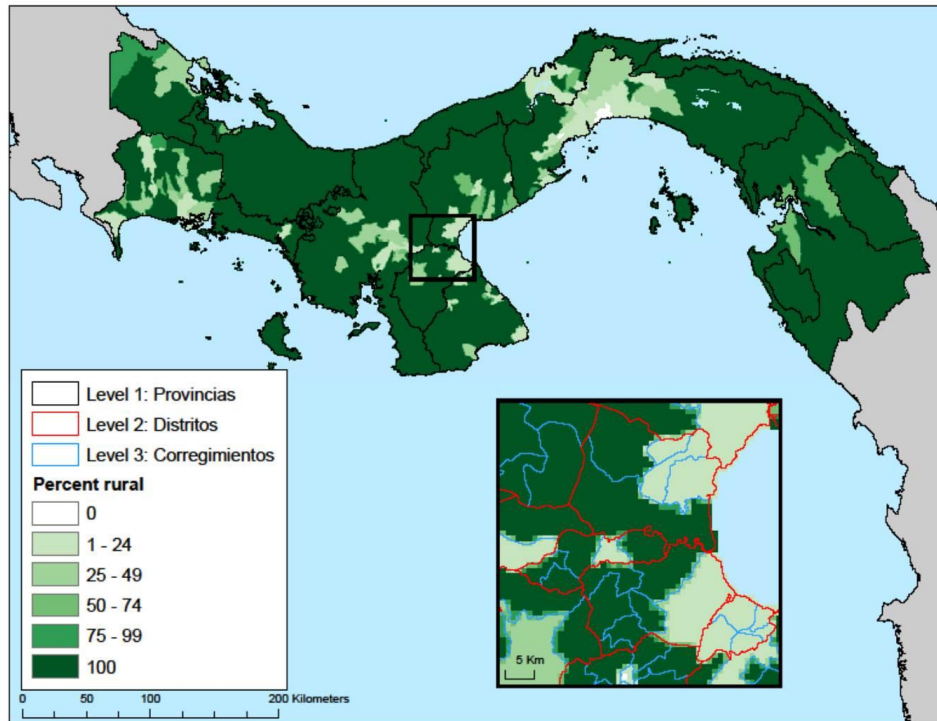

- Sex
- Age (single year or 5-year age groups)
- Urban/Rural status

# 2

## Addition of gridded census variables

% Rural population, 2010, Panama

% Urban population, 2010, Panama

# Improvements to GPWv4

1

Increased resolution of input census units

↳ Increases the accuracy of the data product

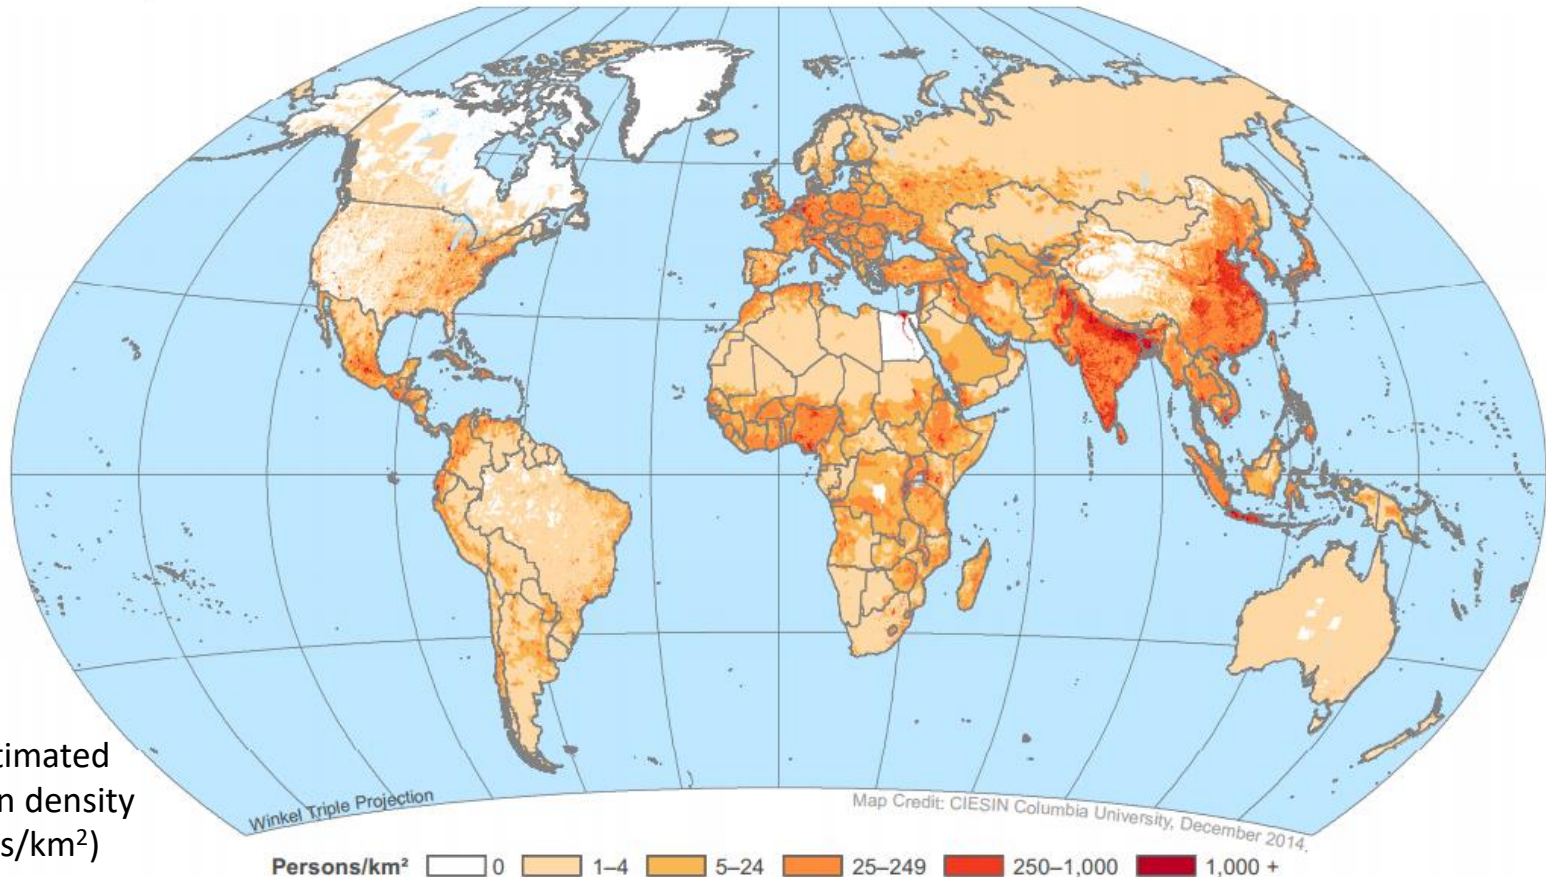

2

Addition of gridded census variables

↳ Extends the applicability of GPWv4

# GPWv4 Data Collection

- Population Density
- Population Count
- Land Area
- Data Quality Indicators:
  - Water Mask
  - Data Context
  - Mean Admin Unit Area
- National Identifier Grids
- Centroids

# Many gridded pop products

1994 → GPWv1

2015 → GPWv4, GRUMP, LandScan,  
WorldPop, Geostat...

# Different products for different uses

	Coverage	Resolution	Population	Method	Ancillary data used	Method consistency
<b>GPWv4</b>	Global	1km	Residential	Areal-weighting	None	Globally consistent
<b>GRUMP</b>	Global	1km	Residential	Dasymetric mapping	Nighttime lights, settlement points	Globally consistent
<b>LandScan</b>	Global	1km	Ambient	Dasymetric mapping	Roads, slope, elevation, land cover, urban boundaries, nighttime lights	Varies by country
<b>WorldPop</b>	Africa, Asia, Central and South America	100m - 1km	Residential	Dasymetric mapping	Land cover, settlement boundaries, roads, nighttime lights, health facility locations	Varies by country
<b>Geostat</b>	Europe	1km	Residential	Aggregation of microcensus; disaggregation and spatial modelling	Land cover, roads	Varies by country

# Additional GPWv4 Modeling

- GHSL
  - Integration of GPW and GHSL via a joint project with JRC
- VIIRS
  - Day-Night band from the joint NASA-JAXA Suomi NPP satellite
  - Relationship between high resolution census data (population density) and emitted lights
  - Use relationship to reallocate population in areas of low resolution census data

# Population-Light Relationship

GPWv4 population density

VIIRS brightness

Scatterplot

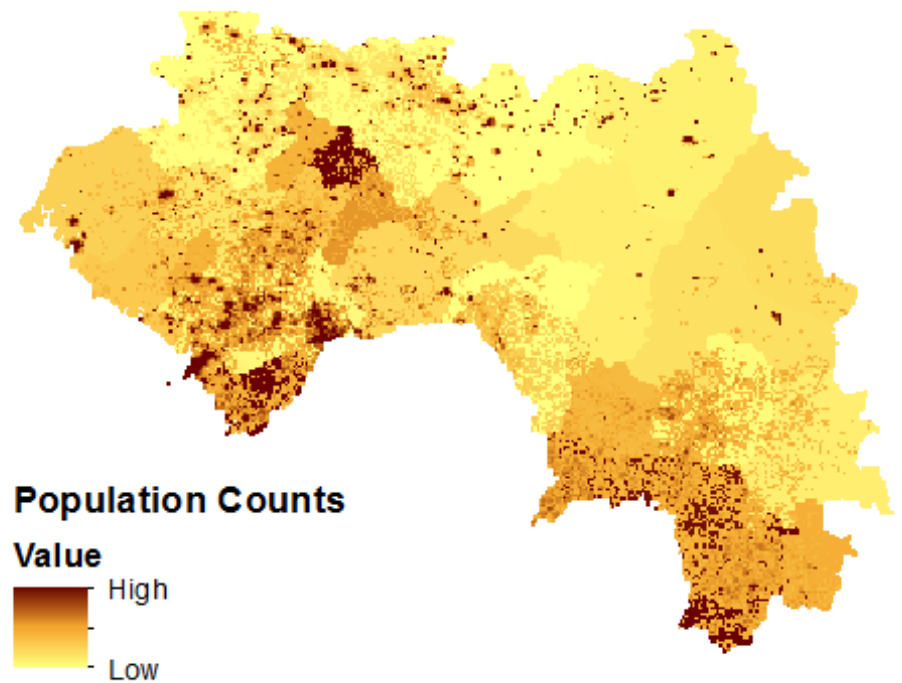

Linear transfer functions

# VIIRS Test Case: Guinea

Proportional Allocation (GPWv4)

VIIRS Reallocation

# Overall, GPW is a census-based global population grid that is:

- Free and open source
- Well-documented
- Transparent
- Highly used
- Widely applicable
